

Perfect logistics and assembly

Hittech Comac BV is a co-maker and constructs precision engineered and mechatronic machines, (sub)modules and equipment under contract to OEM companies, overseeing the entire process, with the emphasis on purchasing, logistics and assembly.

Hittech Comac's clients include those from the graphics industry, the packaging industry, the semiconductor industry and the medical and laboratories sector.

As part of the Hittech Group BV, Hittech Comac benefits from the synergy created through its sister companies (in the fields of design and engineering), making it an attractive production partner.

As co-maker, Hittech Comac focuses on the construction of precision engineered and mechatronic machines, (sub)modules and equipment for OEM companies; businesses that would rather concentrate on their core activities, i.e. the development and sale of their machines.

To supply a technically advanced, but financially appealing product, Hittech Comac utilizes its three key competences: purchase, logistics and assembly.

In the field of purchasing, Hittech Comac can be considered a specialist in obtaining both in-house and outsourced components: the company has access to an extensive network of domestic and foreign suppliers, allowing it to provide the optimum blend of delivery times, quality and prices. In logistical terms, it is not only the flow of parts that is important; we believe that open and direct communication with the supplier and the client is absolutely essential. Assembly is the jewel in our crown: besides supplying a functioning construction or (sub)module, ideas are generated to ensure that subsequent series are produced even more efficiently and/or more cost-effectively. Stringent control of our processes and quality standards enables us to guarantee cycle times, quality and prices.

The markets Hittech Comac focuses on are:

1. Graphics
2. Packaging
3. (Shrink)film treatment
4. Optics

The key competences of Hittech Comac are:

Purchasing: Hittech Comac utilizes various domestic and foreign suppliers of in-house and outsourced components that are brought together in the Hittech Group database, and is constantly searching for the perfect balance between quality (always the dominant factor), delivery times and prices.

Logistics: It is not only the flow of parts that is managed efficiently; logistics also includes communication, ensuring the organisation runs smoothly.

Assembly: Assembly is the final phase of the process, and acts as the last quality-control moment for the components supplied.

If required, Hittech Comac will carry out post-assembly functional tests, and can also offer support in the field of design and engineering using expertise from the Hittech Group.

Organisation

Hittech Comac employs staff qualified in the fields of purchasing, logistics and assembly. Our people are given plenty of room to use their own initiative, despite our tightly run organization: when directly involved in the production process, they are at liberty to suggest areas for improvement so that the production of a construction or (sub)module can be carried out even more efficiently in the future.
